Human genomic polymorphic nucleic acid segments, allele specific primers and probes, and methods of analysis, useful for e.g. forensics, paternity Claim 1; Page 21; 141pp; English.

The present invention describes a nucleic acid segment of 10-100 contiguous bases chosen from one of 632 fragments (AAA78631 to AAA79262), where the segment comprises a polymorphic site or an immediately adjacent base, or the complement of the segment. Also described are: (1) an allelectory of the complement of the segment. Also described are: (1) an allelectory of the complement of the segment of the novelty; (2) an isolated nucleic acid comprising a sequence of the novelty where the polymorphic site within the sequence is occupied by a base other than the sepecification; and (3) analysing a nucleic acid, comprising obtaining a nucleic acid from an individual, and determining a base occupying any one of the polymorphic sites of the novelty. The nucleic acid segments and method can be used to analyse an individuals nucleic acid segments and method can be used to analyse and individuals nucleic acid segments for the presence of polymorphisms. The presence of the phenotype and correlate the presence of the phenotype in a particular polymorphism. The presence of polymorphisms with phenotypic traits and for genetic mapping of phenotypic traits and for genetic mapping of phenotypic traits. AAA78611 to AAA78252 represent sequence tags of human genomic DNA fragments containing polymorphic sites. The base occupying the polymorphic site is indicated using IUPAC-IUB

testing, genetic mapping,.

The present invention describes a nucleic acid segment of 10-100 contiguous bases chosen from one of 632 fragments (AAA78631 to AAA79262), where the segment comprises a polymorphic site or an immediately adjacent base, or the complement of the segment. Also described are: (1) an allelespecific oligonucleotide that hybridises to a segment of the novelty; (2) an isolated nucleic acid comprising a sequence of the novelty where the polymorphic site within the sequence is occupied by a base other than the reference base indicated in the specification; and (3) analysing a nucleic acid, comprising obtaining a nucleic acid from an individual, and determining a base occupying any one of the polymorphic sites of the novelty. The nucleic acid sequences for the presence of polymorphisms. The method can also be used to test for a disease phenotype and correlate the presence of the phenotype with a particular polymorphism. The presence of polymorphisms with phenotypic traits and for genetic mapping of phenotypic traits. AAA78631 to AAA79262 represent sequence tags of human genomic DNA fragments containing polymorphic sites. The pass occupying the polymorphic site is indicated using IUPAC-IUB nomenclature

```
The present invention describes a nucleic acid segment of 10-100 contiguous bases chosen from one of 632 fragments (AAA78631 to AAA79262), where the segment comprises a polymorphic site or an immediately adjacent base, or the comprises a polymorphic site or an immediately adjacent especific oligonucleotide that hybridises to a segment of the novelty. (2) an isolated nucleic acid comprising a sequence of the novelty where the polymorphic site within the sequence is occupied by a base other than the reference base indicated in the specification; and (3) analysing a nucleic acid, comprising obtaining a nucleic acid sequences for the polymorphic sites of the novelty. The nucleic acid segments and method can be used to analyse an individuals nucleic acid segments and method can be used to analyse an individuals nucleic acid segments and method can be used to analyse and individuals nucleic acid sequences for the presence of polymorphism. The presence of the phenotype with a particular polymorphism. The presence of the phenotype with a particular polymorphism. The resence of polymorphic sites are useful for, e.g. forensics, paternity testing, correlation of polymorphic traits. AAA79262 represent sequence tags of human genomic DNA fragments containing polymorphic reals. The case of human genomic DNA fragments containing polymorphic reals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                  Human genomic polymorphic nucleic acid segments, allele specific primers and probes, and methods of analysis, useful for e.g. forensics, paternity testing, genetic mapping,.

The invention describes a nucleic acid molecule comprising one of 525 31 nucleotide sequences, given in the specification, or at least 10 nucleotides in length, and comprising a polymorphic site, where the nucleotide at the polymorphic site is different from a nucleotide at the polymorphic steens the sequence allele. The nucleotide at the polymorphic steens are useful in forensics comprising a single nucleotide polymorphism are useful in forensics (e.g. to identify an individual), in paternity testing, in correlating polymorphisms with phenotypic traits, and in genetic mapping of phenotypic traits. The correlation between a particular polymorphic form of a gene and a phenotype can be used in the diagnosis of that phenotype, as well as in the development of treatments for the phenotype. This sequence represents a fragment of a human gene found to containing a single nucleotide polymorphism following re-sequencing. The regions can be used to develop primers and probes for use in detect the SNP regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                              New nucleic acids comprising single nucleotide polymorphisms, useful in forensics (e.g. to identify an individual), paternity testing, correlating polymorphisms with phenotypic traits, and genetic mapping of

ŏ Detecting or diagnosing a kidney disease, e.g. renal cancer or glomerulomphirtis, comprises determining the presence of expression podocyte gene for nephrin or proximal tubular cell gene for Indian hedgehog in a urine sample.

Claim 39; Page 24; Opp; English.

The present invention relates to a method of detecting a kidney disease, which comprises screening a mammalian urine sample for expression of a specific gene that is present in the urine sample only when cells indicating kidney disease are present, where the concentration of detectable albumin in the urine sample has a range of 0-30 mg/dl. The method is useful for detecting or diagnosing a kidney disease or disorders associated with e.g. glomerulonephritis, nephritic syndrome, diabetes, lupus, hypertension, acute tubular necrosis, renal obstructive disorders, renal cancers, and other diseases or symptoms. The podocyte gene for nephrin or the proximal tubular cell gene for Indian hedgehog is useful as selectable markers for a kidney disease. The present sequence is a PCR primer used to detect the human beta-actin gene

Selective elimination of non-targeted DNA sequences for rapid isolation and enrichment of the differences of DNA fragments between two pools of DNA, comprises converting testers to drivers.

Claim 6; Col 5; 23pp; English

of DNA fragments between two pools of DNA, comprises converting undesirable testers (DNA being subtracted) to drivers (DNA used to subtracted) and re-utilising converted drivers in repeats of subtraction to achieve double exponential elimination of undesirable tester sequences. invention comprises rapid isolation and enrichment of the differences The method comprises (a) attaching a nucleic acid fragment to 1 or more

CC polymerase chain reaction (PCR) adapters to form an adapter-attached nucleic acid fragment, followed by amplifying the adapter-attached nucleic acid fragment through PCR with primers containing nucleic acid capter through PCR with primers containing nucleic acid capter through PCR with primers containing nucleic acid capter that contains no attached adapter that contains no attached adapter whose sequence differs from the adapter to form a nucleic acid mixture, (d) adding to the nucleic acid mixture, (c) denaturing and re-annealing the tester/drive nucleic acid mixture, (d) adding to the nucleic acid mixture an effective amount of reagents necessary for removing the adapter sequence from the tester/ driver hetero-duplex and (e) repeating of step (c) to (d) at least once (no amplification takes place and no additional driver is added). The method is used for rapid isolation and enrichment of the differences of DNA fragments between two pools of DNA contribution in the search for tumour specific sequences. The method has 2 improvements over the methods disclosed by Anny et al. (1993), Straus et al. (1990) by (i) bypassing the need of a colymerase chain reaction (PCR) amplification or physical separation of desirable testers from undesirable ones in each repeat of climinates the necessity of tester dilution in each repeat of subtraction, it eliminates the need of subtraction. The present of subtraction. The present of subtraction. The present of subtraction. The present of sequence is an Oligo D(T) PCR primer used in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence represents a SMART PCR primer used to synthesise first strand cDNA from Atlantic cod in order to isolate cDNAs encoding heat-labile uracil-DNA glycosylase, (UNG/UDG). The enzyme is useful in monitoring and/or controlling a reaction system multiplying DNA sequences, e.g. PCR (polymerase chain reaction) or LCR (ligase chain reaction). The enzyme is also useful in carry-over prevention procedures
useful in the diagnosis of pathological conditions. The method enables preparation of cellular gene expression profile from an extremely small number of cells, pathological samples, micro tissues, etc., whose handling has been infeasible because of limited sample amount. The gene-expression profile can be obtained from trace amounts of sample by improved high coverage gene-expression profile analysis method. The method has high detection sensitivity with respect to gene expression. The present sequence represents a cDNA first strand synthesis primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cod liver uracil-DNA glycosylase enzyme, useful in monitoring or
rolling a reaction system multiplying DNA sequences or in carry-over

The present invention relates to fibrinolytic enzyme, brevinase (see AAG79000), which is separated from the poison of Agkistordon blomhoffi brevicaudus (mamushi). The enzyme shows stability at high temperatures and is thus useful in developing thrombolytic agents. The present sequence is a PCR primer, which was used in an example from the present invention. (Updated on 11-SEP-2003 to standardise OS field)

Probe MRCO64 is bound by a hydrolysable linkage to a solid support at its 3' end. It is used by reacting excess probe with a target nucleic acid; nicking hybridised probe at least once within a predetermined sequence to from 2 or more probe fragments hybridised to the target sequence, which results in the probe fragments becoming hybridised to another probe; and identifying probe fragments, so detecting the target sequence. The probe can react with target sequence to complete a cycling sequence. Using this system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can be obtd. The probe is cleavable at the libonucleotides by a ds RNase, eg RNase H or ExoIII. (Updated on 13-0CT-2002 to add missing OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Overexpression of the enzyme glutathione-s-transferase pi has been implicated as being responsible for the broad range drug resistance which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic oligo-nucleotide(s), prodn. useful e.g. for HIV-1 inhibition which bind to target sequence in duplex DNA forming colinear triplex by binding to major groove.
                                                                                                                               Detecting target nucleic acid molecules - using excess complementary nucleic acid probes and nicking to complete a cycling sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Glutathione-s-transferase pi, cancer; drug resistance; chemotherapy; sensitisation; triplex; target; duplex; ss.

                                                                                                                                                                                                                                                                                               The patent claims a new molecule of formula (NA1----S----NA2)n. NA1 and NA2 are noncomplementary nucleic acid sequences; ---S--- = a scissile linkage; n= 1 or 1,000, which is used for the detection of specific DNA sequences in a test soln. The scissile link probes may be PL (Permanent Linkage to Solid Support) or HL (Hydrolysable Linkage to Solid Support). The differential liability of DNA and RNA may be exploited in a heterogenous system when the scissile linkage is an RNA molecule. In the samples, counter probe molecules 9 through 16 were used to determine suitable hybridisation conditions. (Updated on 03-OCT-2002 to add missing OS field.)
                                                                                                                                                                                                                   Synthetic nucleic acid probes - comprising two nucleic acid sequences

Expression of the gene may be prevented by the formation of a triple between the duplex target DNA sequence and an anti parallel or parallel synthetic oligonucleotide. A suitable target sequence is that from base -499 to -410 of GSTpi, an unusual repetitive DNA segment within the control domain. Oligonucleotides targetted against this sequence will repress GSTpi transcription. See also AAQ36219-362. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            target nucleic acid presence in a sample. A preferred target is a Mycobacterium complex nucleic acid sequence. The detection method uses visual detection of a change in the hybridization without aid of instrumentation. Multiple copies of a target nucleic acid sequence are mixed with first and second detectable probes under hybridizing conditions favouring particle agglutination via a bridging molecule allowing for visual detection of the target nucleic acid sequence. The bridging molecule enhances or inhibits formation of a hybridization
                                                                                                                                          Visual, nucleic acid detection; target; hybridisation; probe; primer; agglutination; bridging molecule; ss.

response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immuno response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. berpesviridae, retroviridae haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone
                                                                                                                                                                                                                                                                             Vaccinating against tumors, infectious diseases, allergies and asthmausing immunostimulatory Py-rich and TG nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for stimulating an immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining an analyte in a sample, for generating multiple double
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   88; 5'-A30-3'; double stranded DNA generation; promiscuous base;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acid. The immunostimulatory nucleic acid can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. toxoplasma, namoprilus, campylobacter, clostridium, Bscherichia coli and/or staphylococus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vaccine, cytostatic, virucidal, bactericidal, fungicidal, anti-parasitic, immunostimulatory, tumour, viral infection, bacterial infection; fungal infection; parasitic infection; cancer, asthma; infectious disease; allergy; immune deficiency; phosphorothioate; ss.

stranded nucleic acids, comprises employing a single primer sequence with a nucleobase sequence having affinity to the sequence contained in a target nucleic acid.

Example 1; Col 14; 25pp; English

The intention relates to determining an analyte in a sample computation of the providing a target nucleic acid comprising a region A, a nucleobase sequence B, and a sequence I linked to the 5' terminus of the nucleobase sequence B, where the nucleobase sequence B is not specific for the sequence B, where the nucleobase sequence B is not specific for the sequence B, where the sample, (d) binding the target nucleic acid from the remaining part of the sample, (d) the target nucleic acid from the remaining part of the sample, (d) the formal a primer to the nucleobase sequence B', and the nucleobase sequence B', and the nucleobase sequence B' and the nucleobase sequence B', and the nucleobase sequence B' as a template and using nucleotides, where at least 30 % of the nucleotides contain at least one promiscuous base which is capable of searching with each of adenine, guanine, cytosine, and thymine, (E) separating the target nucleic acid from the elongation product E, where the elongation product E, where the elongation product E is capable of acting as a template for the elongation of the further primer, (h) separating the hybridised further primer of step (d) to produce an elongation product E, where the elongation product E is capable of acting as a template for the elongation product E, where at least 10 % of the nucleobase sequence B' (i) separating the elongation product E' (j) hybridising a template and using the elongation product E' (j) hybridising a template and using nucleotides, where at least 30 % of the nucleobase sequence B' (i) separating the elongation product E' (j) to produce C another elongation product E', (j) hybridising a further primer of step (j) to product E (m) product E as a template and using nucleotides, where at least 30 % of the nucleobase sequence B' (k) elongating the further primer of step (j) to product E, (m) could be a template and using nucleotides, where at least 30 % of the nucleobase sequence B' (j) to product E as a template and using nucleotides contain at least nucleobase determining the elongation product B and/or elongation product B' as a measure of the presence or amount of the analyte, where the lengths of the sequence I and the mucleobase sequence B are chosen such that, when the further primer bypridises to the elongation product E in step (g), the further primer spans a sequence formed by elongation of the Pybridised primer of step (e) and overlaps at least a part of the 3' region of the hybridized primer of step (e) by an overlap length. The method is useful determining an analyte in a sample. In particular, the method is useful for generating multiple double stranded nucleic acids. The present sequence is a primer molecule used to exemplify the method of the invention invention relates to determining an analyte in a sample comprising

comprising the sequence (CTATTTT) n and its complement (AAAATAG) n, where n is 1. The probe sets of the invention are useful for detecting kappa or lambda-immunoglobulin light chain mRNA or corresponding heteronuclear RNA, CWY (cytomegalovirus) immediate early RNA, EBW (Epstein-Barr virus) early RNA 1 and RNA 2, and human Alu repetitive satellite genomic sequences. The invention is a useful generic sequence for incorporation into oligonucleotide probes for detecting gene-specific sequences within cells or tissue samples in in airu hybridisation analysis and for attaching a label to immunoblatochemical analyses. The present nucleic acid sequence represents one of a collection (ABK70376-ABK70501) of oligonucleotide probes that were used in the invention for detecting or collisonucleotide probes that were used in the invention for detecting or localising a plurality nucleic acid target gene or antigen within a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel oligonucleotide label-domain for incorporation into oligonucleotide probes useful for detecting or localizing nucleic acid target genes within a cell or tissue sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a new oligonucleotide label-domain
                                                                                                                                                                                                                                                     Human, oligonucleotide label-domain; CMV; cytomegalovirus; EBV,

The invention describes a novel fluorescent dye and method of detecting nucleic acid. The dye and method are useful for nucleic acid probes for measuring nucleic acid s) containing a specific nucleic acid probes for a measuring nucleic acid solution to a sample, and for qualitative/quantitative assay of target RNA containing a specific base sequence anticipated in gene mixture. The assay is useful contained diagnostics and in send diagnostics and in cidentification/quantification microoxganisms in biological samples such as serum, plasma and urine, microbially contaminated samples such as serum, plasma and urine, microbially contaminated samples such as serum, plasma and sea. The fluorescent intercalation dye shows a large fluorescent enhancement upon intercalation into double-stranded concleic acid, and shows a great difference between excitation and concleic acid, and shows a large Stokes shift) and does not have a fluorescent spectrum that overlaps with those of conventionally known cluorescent spectrum that overlaps with those of conventionally known cluorescent intercalation dyes. Viruses, microbial RNAs, specific sequences in one RNA, are detected or quantified in a short time, hence the detection method is applicable to clinical diagnosis which requires high reliability. Amplification and extraction efficiencies of the target on uncleic acid, are checked. This sequence represents a synthetic DNA used construction by a construction by an activity by a construction and extraction efficiencies of the target on a checked. This sequence represents a synthetic DNA used

Fluorescent dye or its salt, hydrate, solvate or stereoisomer for nucleic acid probe for measuring nucleic acid(s) containing specific nucleic acid sequence in sample, has specific formula.

                                                                                                                                                                                                                        The invention describes a microarray comprising QC probes and a method for fabricating the microarray. The microarray comprising QC probes has the complementary nucleotide sequence with that of a target gene or any nucleotide sequence material albeled to the target gene or any different from the fluorescence material labeled to the target gene, wherein the fluorescence material is labeled at the 3-terminal 55-terminal or intermediate of the QC probes, a spacer is further contained between the nucleotide sequence of the probes and fluorescence material; the QC probes can be cDNA, oligonucleotides, peptides or proteins. The method for fabricating the microarray comprising QC probes involves fixing the QC probes and target probe involves substrate, wherein the QC probes and target probe on a substrate, wherein the QC probes and target probe on a substrate, wherein the QC probes and target probe on a substrate, wherein the QC probes and target probe are fixed in a spot at the same time. This sequence represents an oligonucleotide associated with the microaray of the invariance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Analyte detection; DNA detection; protein detection; MecA gene; probe;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the preparation of 3'-amino oligonucleotide derivatives. The method comprises providing solid support benzene derivatives. The method comprises providing solid support benzene derivatives, synthesising an oligonucleotide pursuant to standard techniques for solid phase oligonucleotide synthesis (SPOS) where the oligonucleotide chain is assembled on the solid support, cleaving the oligonucleotide from the solid support and deprotecting the oligonucleotide completely except for the terminal protective group. The oligonucleotides are useful in the synthesis of bi-fluorescent probes. This process suppresses the undealred formation of unmodified 3'-OH oligonucleotides through cyclic phosphate intermediates and reduces the probability of errors resulting from the use of different sets of oligonucleotides. This sequence represents an invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The present invention provides a method for detecting the presence or absence of a single target molecule or target analyte (e.g. nucleic acid, protein, lipid, bacterium). The method involves contacting sample with one or more types of nanoparticle having target binding complements and detecting any light scattering complex formed. The nanoparticle probe complexes comprise two or more probes bound to a specific target analyte. The present sequence is a Staphylococcus aureus MecA gene specific probe. This sequence is used in the preparation of nanoparticle-oligonacleotide conjugate probes. Note: The present sequence is the SEQ ID No: 25 shown on page 25 in example 25 of the specification. This sequence differs from the SEQ ID NO: 25 given in the sequence listing (see AED67954). Detecting target (e.g. nucleic acid, protein, lipid, bacterium) in sample, comprises contacting sample with one or more types of nanoparticle having target binding complements, and detecting any light scattering complex formed. Garimella V; Σ Senical Bao YP, Example 25; SEQ ID NO 25; 70pp; English. Muller UR, Lucas A, WPI; 2005-784662/80.

(NANO-) NANOSPHERE INC.

Garimella V; Senical M, Bao YP, Muller UR, Storhoff JJ, Lucas A, WPI; 2005-784662/80. Detecting target (e.g. nucleic acid, protein, lipid, bacterium) in sample, comprises contacting sample with one or more types of nanoparticle having target binding complements, and detecting any light scattering complex formed.

Example 25; SEQ ID NO 29; 70pp; English.

The present invention provides a method for detecting the presence or absence of a single target molecule or target analyte (e.g. nucleic acid, protein, lipid, bacterium). The method involves contacting sample with one or more types of nanoparticle having target binding complements and detecting any light scattering complex formed. The nanoparticle probe complexes comprise two or more probes bound to a specific target analyte. The present sequence is a methicillin resistant Staphylococcus aureus (MRSA) MecA gene specific probe. This sequence is used in the preparation of nanoparticle-oligonucleotide conjugate probes. Note: This sequence is incorrectly designated as SEQ ID NO: 25 in example 25 (page 25) of the specification

Parallel sequencing of nucleic acids by optical methods, by cyclic primer -matrix extension, using a solid phase with reduced non-specific binding of labeled components.

Disclosure; Page 97; 144pp; German.

This invention relates to a novel method for parallel sequence analysis of nucleic acids (NA) by optical means using a novel solid phase (SP). The SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids, so the background remains low even after prolonged and repeated contact of the solid phase with high concentrations of labeled

This invention relates to a novel method for parallel sequence analysis of nucleic acids (NA) by optical means using a novel solid phase (SP). The SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids, so the background remains low even after prolonged and respected contact of the solid phase with high concentrations of labeled reagents. The present sequence is that of an oligonucleotide which was used in the development of the novel method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Parallel sequencing of nucleic acids by optical methods, by cyclic primer -marrix extension, using a solid phase with reduced non-specific binding of labeled components.
                                                                                                                                                                                                                                DNA chip; biochip; DNA detection; DNA microarray; DNA sequencing;

                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method for parallel sequence analysis of nucleic acids (NA) by optical means using a novel solid phase (SP). The SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids, so the background remains low even after prolonged and respected contact of the solid phase with high concentrations of labeled reagents. The present sequence is that of an oligonucleotide which was used in the development of the novel method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Parallel sequencing of nucleic acids by optical methods, by cyclic primer -matrix extension, using a solid phase with reduced non-specific binding of labeled components.
   reagents. The present sequence is that of an oligonucleotide which was used in the development of the novel method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

This invention relates to a novel surface of a solid phase (SP), useful in methods for parallel analysis of many individual nucleic acids (NA) by optical methods. The novel SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids. The present sequence is that of an oligonicleotide which was used in the development of the novel solid
                                                                                                                                                                                                                                                         Surface of solid phase, useful for parallel, optical analysis of many nucleic acids, has reduced non-specific binding of labeled components
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA chip; biochip; DNA detection; DNA microarray; DNA sequencing; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel surface of a solid phase (SP), useful in methods for parallel analysis of many individual nucleic acids (NA) by optical methods. The novel SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids. The present sequence is that of an oligonucleotide which was used in the development of the novel solid phase of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Surface of solid phase, useful for parallel, optical analysis of many nucleic acids, has reduced non-specific binding of labeled components.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel solid support surface for parallel analysis of many individual nucleic acids by optical methods. The invention also describes, a) a solid phase in which the surface shows reduced non-specific binding of labeled components; b) methods for preparing the novel solid support and c) methods of parallel analysis of
                                                                       This invention relates to a novel surface of a solid phase (SP), useful in methods for parallel analysis of many individual nucleic acids (NA) by optical methods. The novel SP is useful for multiple parallel sequencing of nucleic acids and shows reduced nor-specific binding of labeled or unlabeled nucleotides and nucleic acids. The present sequence is that of an oligonucleotide which was used in the development of the novel solid
                    Surface of solid phase, useful for parallel, optical analysis of many nucleic acids, has reduced non-specific binding of labeled components
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Surface of a solid support, useful for multiple parallel analysis of nucleic acids by optical methods, having low non-specific binding of labeled components.

contracted acid by optical methods, using the solid support. The surface of the solid support is made of silica, glass, silicon dioxide or si-Odi; is flat and has uncleic acid chains fixed to it, optionally chrough a linker. The solid phase is preferably part of a device that allows fluid exchange and it is permeable to light in the wavelength cregions 200-400; 200-2000 or 400-800 min. An external layer of solid cupport is removed, then the nucleic acid is coupled to it, optionally cupport is removed, then the nucleic acid is coupled to it, optionally after attachment of a linker layer. Alternatively, after removing the external layer, nucleic acids are synthesized on the surface by cyclic coupling, optionally after attachment of a linker, and in either case, actachment or synthesis of nucleic acide on the surface layer attachment or synthesis of nucleic acide on the surface is not attachment or synthesis of nucleic acide on the surface is not direct containing monomers or polymers) can be compaid, especially to remove a layer 1 nm to 100 micron thick. Solutionally after removal of the surface layer, the surface is not direct and all subsequent steps are done in a liquid phase. The nucleic acids and lyzed represent a single population or many different populations and contains s-50, 20-200 or 50-500 nucleotides. The linker is 1-50 nm long can alize brinker-matrix complexes. The linker has a branched or linear polymer: (etrept) avidin or a nucleic acid etriphosphates, in which the label is cleavable. Particularly analysis involves cyclic sequencing and a preferred method contains 30-300 or t, RNA or DNA, and the solid support, with formation of a ceromatrively the nucleic acid is fared to the support and then actions and thermatrial sequences that function as primers for the sequencing and the achieve that primer. The innocrporated mucleotide can be contains 30-300 or t, RNA or DNA, and the solid by acception or alternatively the nucleic acid is fared to the support and then achieve the function of a reversible ss; dna detection; DNA sequencing; DNA amplification; oligo dT40-biot. Gaps Optical DNA analysis process-related oligonucleotide dT40-biotin. so assay sensitivity is improved. This sequence represents an oligonuclectide used to illustrate the method of the invention. ö Length 30; Indela Sequence 30 BP; 0 A; 0 C; 0 G; 30 T; 0 U; 0 Other; . 1.1%; Score 30; DB 1; L 100.0%; Pred. This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked bhase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide drilo-cy3 which was used in the development of the novel process of the invention.
                                                                                Optical fluorescent parallel process to analyse nucleic acid chains in which a sample solid is bound with a primer-matrix complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Optical fluorescent parallel process to analyse nucleic acid chains in which a sample solid is bound with a primer-matrix complex.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the sequence repeated as necessary. The solid phase is then washed and the sequence repeated as necessary. The process is faster, more efficient and cheaper than prior art. Further claimed is that the process efficient and cheaper than prior art. Further claimed is present sequence is that of olisjonucleotide d740-biot which was used in the development of the novel process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                           Optical fluorescent parallel process to analyse nucleic acid chains in which a sample solid is bound with a primer-matrix complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ss; dna detection; DNA sequencing; DNA amplification; oligo dtT30-Cy3.

This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclid reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. Further claimed is that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide dT40-Cy3 which was used in the development of the novel process of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked mucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. The present sequence is that of oligonucleotide dT40-cy3 which was used in the development of the novel process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Optical fluorescent ultra-high parallel process to analyse nucleic acid chains in which a sample solid is bound with a primer-matrix complex.

                                                                 This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide drillo-cy3 which was used in the development of the novel process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide difforbict which was used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ultra-high parallel analysis process to analyse nucleic acid chains in which a sample solid is bound and substrate material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   вв; dna detection; DNA sequencing; DNA amplification; oligo dT40-Cy3.

This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nuclectides are incorporated in the primer matrix by enzyme reaction, followed by are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nuclectides are detected and their co-ordinates logged and the signals removed. The marked nuclectides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. Further claimed is that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide dT40-Cy3 which was used in the development of the novel process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Contryphan; leu-tryphan; anticonvulsant; neuroprotective; venom; cone snail; neurodegenerative disorder; epilepsy; neurotoxic injury; hypoxia; anoxia; ischaemia; stroke; cerebrovascular accident; brain trauma; spinal chord trauma; myocardial infarct; physical trauma; drowning; suffecation; perinatal asphyxia; hypoglycaemia; migraine; senile dementia; Alzheiner's disease; anyotrophic lateral selerosis; Parkinson's disease; Huntington's disease; bown's syndrome; PCR primer; korsakoff's disease; schizophrenia; neuronal damage; seizure; ss.

The present invention relates to a method (M1) for detecting and/or isolating a nucleic acid having a homopolymeric sequence or repetitive element or conserved nucleotide sequence. (M1) comprises treating a sample containing nucleic acid compounds with an locked nucleic acid (LNA) oligonucleotide (LO) to thereby detect and/or isolate a nucleic acid having the homopolymeric sequence or repetitive element or conserved nucleotide sequence. (M1) is useful for detecting and isolating nucleic acids released from a lysed complex biological mixture comprising nucleic the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting and/or isolating nucleic acid molecule having homopolymeric sequence or repetitive element or conserved nucleotide sequence involves treating sample containing nucleic acid compounds with locked nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence sequence represents a PCR primer for a contryphan peptides are lound in the venom of cone shalls. The contryphan peptides are useful as anticonvulsant agents, as neuroprotective agents, for managing pain, and for treating neuroprotective agents, for managing pain, and for treating neuroprotective agents, for managing pain, and for treating from an overstimulation of excitatory amino acid receptors. The contryphans are useful for the treatment and alleviation of excitatory amino acid receptors. The contryphans are useful for the treatment and alleviation of hypoxia, anoxia, or ischaemia which typicially follows strok, cerebrovascular accident, brain or spinal chord trauma, myocardial infarct, physical trauma, drownings, or spinal chord trauma, myocardial infarct, physical trauma, drownings, are further useful for the treatment of Alzheimer's disease, senile dementia, amyotrophic lateral sclerosis, Parkinson's disease, senile dementia, amyotrophic lateral sclerosis, Parkinson's disease, thutington's disease, bown's syndrome, Korsakoff's disease, senile associated with uncontrolled seizures. The contryphans are further useful for used prophylactically or to relieve the symptoms associated with a controlling pain and are effective in the treatment of migraine. They

                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                              Sequence forms triplex with the double stranded target sequence with G binding to G-C and T to A-T. The strand runs 3' to 5' in an antiparallel orientation and when targeted to a specific sequence will deactivate it. This allows for growth inhibition in cancerous cells, manipulation of cellular structural protein content; inhibition of IL-2 chain receptor; disbursing plaque formation in Alzheimer's disease; inhibiting EGF gene; modulating cholestrol synthesis through the HMGCAOA gene; suppressing NGF gene expression; arresting HSV-I replication and suppressing Beta-globin expression in thallassaemia and sicle cell anaemia patients. ```
The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using a template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or compared pML. The method is used to identify microsatellite markers, in a consease and for predisposition to diseases associated with a predisposition to diseases and for predisposits of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, consensus or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a prion protein polymorphic microsatellite marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Multisignal labeling reagent associated oligonucleotide segid 2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a composition (I) of matter comprising an oligomer or polymer having two or more labeled groups, where the label or labels are chemically linked to the oligomer or polymer, one or more caractive groups, and one or more charged groups where the charged groups are covalently linked to the oligomer or polymer, or or on or more caractive groups, and one or more charged groups where the charged groups are covalently linked to the oligomer or polymer, or comprise part of the oligomer or polymer, or any of their combination. Also described are: a composition (II) comprising of their combination. Also been labeled using (I); and a composition (III) prepared by a target of labeling process comprising (I) providing a target for labeling, and a composition (II) providing a target for labeling, and a composition (II) providing a target for labeling, and a composition of (II) reacting the correct or (IV). (I) is useful for target and the labeling reagent to form the composition having the correcting or quantifying an analyte in a specimen. (II) or (III) is useful for (III), where the target is an analyte specific moiety, contacting the correcting or quantifying an analyte, which involves providing (II) or (III) where the target is an analyte specific moiety, contacting the amount of (II) or (III) bound to analytes in the specimen correspondent of (II) or (III) bound to analytes in the specimen or signal that is added to the analyte specific moiety, the containing the analyte with the presence of charged groups increases the presence of reactive groups analyte attachment of the multiple labeled groups increases the containing the analyte analyte analyte of the presence of charged group increases the containing the analyte analyte analyte and the presence of charged group increases the containing the analyte and the presence of charged group increases the containing the analyte analyte and the presence of charged group increases the containing the analyte analyte and the presence of charged group incre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                            Composition of multi signal labeling reagents, useful for detecting or quantifying analyte in specimen, has oligomer/polymer having labeled moleties, reactive groups and charged groups linked to oligomer/polymer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            3'-amino oligonucleotide; solid support; benzene derivative; solid phase oligonucleotide synthesis; SPOS; controlled pore glass; CPG; bi-fluorescent probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3'-amino oligonucleotide #4 synthesised on a solid support.

The invention relates to the preparation of 3'-amino oligonucleotide derivatives. The method comprises providing solid support benzene derivatives, synthesising an oligonucleotide pursuant to standard techniques for solid phase oligonucleotide synthesis (SPOS) where the oligonucleotide chain is assembled on the solid support, cleaving the oligonucleotide from the solid support and deprotecting the oligonucleotide completely except for the terminal protective group. The solid phase is a derivatised controlled pore glass (CPO). The 3'-amino oligonucleotides are useful in the synthesis of bi-fluorescent probes. This process suppresses the undesixed formation of unmodified 3'-OH oligonucleotides through cyclic phosphate intermediates and reduces the probability of errors resulting from the use of different reagents for different sets of oligonucleotides. This sequence represents and reduces the different sets of oligonucleotides. This sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Preparation of 3'-amino oligonucleotide derivatives, useful to synthesis bl-fluorescent probes, comprises providing solid support compounds, synthesis an oligonucleotide chain is assembled on the solid support, cleavage and deprotection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human; T-cell associated disease; Vbeta; autoimmune disease; degenerative nervous system disease; graft versus host disease; degenerative nervous system disease; graft versus host disease; Addison's disease; atrophic gastritis; desease; atrophic gastritis; degenerative nervous system disease; multiple sclerosis; degenerative nervous system disease; multiple sclerosis; allergy; type II hypersensitivity, disease; type I hypersensitivity; disease; type II hypersensitivity; disease; type IV hypersensitivity; leprosy; infectious disease; viral infection; tingal infection; Candida; parasitic infection; schistosome; filaria; bacterial infection; Mycobacterium; neoplastic disease; lymphoproliferative disease; leukaemia; lymphoma; cancer; brain cancer; breast cancer; des
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 oligonucleotide synthesised in the examples of the present invention.

The sequences given in ABQ80394-99 represent probes and targets which were used in the method of the invention for detecting a target betwee used in the method of the invention for detecting a target polynucleotide in a sample. The method comprises amplifying the target, polynucleotide in a sample. The method comprises amplifying the target, comparizing the target to oligonucleotide bound to nanoparticles in a nanoparticle detection system, determining the amount of signal generated as a result of binding, optionally repeating the above steps, and companies to the signal produced after at least one amplification cycle. The amount of signal produced after at least one amplification cycle. The companies the quantity of target polynucleotide in a sample, and for determining the quantity of target polynucleotide in a sample. The method is useful in research and analytical laboratories in DNA sequencing, in the field to detect the presence of specific pathogens, in the doctor's of fire for quick identification of an infection to assist in prescribing that are accounted in the method is based on observing colour change with the naked eye, hence the method is cheap, fast, simple, robust, do not require specialized or expensive equipment, and little or no
                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting target polynucleotide in a sample, by amplifying target, hybridizing it to oligonucleotides bound to nanoparticles in nanoparticle detection system, and determining amount of signal generated due to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gold nanoparticle conjugated APC gene probe SEQ ID NO 2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          요
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers or psecifically priming and allowing amplification of each 'Obeta gene, 'ObetaRNA or CDNA. The kit is useful for diagnosing organ transplant crafection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases.

CC including autoimmune diseases, hypersensitivity diseases, infectious diseases, arrophic gastriitis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include multiple clarosis and Alzheimer's disease. Hypersensitivities diseases include multiple clarosis and Alzheimer's disease. Hypersensitivities such as those present in CGoodpasture's syndrome and Type IV hypersensitivities such as those caused by viruses such as HVP, fungal infections such as those caused by the yeast ganus Candida, parasitic infections such as those caused by children in Neoplashic diseases include lymphoproliferative diseases include the harian

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to the detection of a target analyte having at least two portions, which comprises forming a light scattering complex by contacting a sample containing specific binding complement with nanoparticle and with polysaccharide under conditions to allow binding of the specific complement to two or more portions of the target analyte and illuminating the light scattering complex under conditions to produce scattered light from the complex. The invention is useful for detecting target analyte, e.g. nucleic acids or proteins, useful for the diagnosis of genetic and infections diseases. The present sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /mod_base= OTHER

absence of a single target molecule or target analyte (e.g. nucleic acid, protein, libid, bacterium). The method involves contacting sample with one or more types of nanoparticle having target binding complements and detecting any light scattering complex formed. The nanoparticle probe complexes comprise two or more probes bound to a specific target analyte. The present sequence is a human mutant APC gene specific probe. This sequence is used in the preparation of nanoparticle-oligonucleotide The present invention provides a method for detecting the presence or

It is used by reacting excess probe with a target nucleic acid; nicking hybridised probe at least once within a predetermined sequence to form 2 or more probe fragments hybridised to the target sequence, which results in the probe fragments becoming hybridised to another probe; and identifying probe fragments, so detecting the target sequence. The probe system, sensitivity of 10 exp. -19 to 010 exp. -20 molecules of target can be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eggense H or Exoll. (Updated on 31-027-2002 to add missing OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Probe MRCO71 is bound by a hydrolysable linkage to a solid support at its 3, end. It is used by reacting excess probe with a target nucleic acid; nicking hybridised probe at least once within a predetermined sequence to form 2 or more probe fragments hybridised to the target sequence; which results in the probe fragments becoming hybridised to another probe; and identifying probe fragments, so detecting the target sequence. The probe can react with target sequence to complete a cycling sequence. Using this system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

                                                                                                                                                                                                                                                            response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immuno response. The present sequence is one such immunostimulatory nucleic acids can be pyrimidate an nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a ribt to a Thl immune response and to activate immune cells. Note: the

                                                                                     The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Oster-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, hypertrophic scars. The present sequence is an antianglogenic nucleic
        Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating or preventing cancer, such as basal cell carcinoma, comprises administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of

cancer, involving administering to actual marines by the venture developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal carcinoma, bladder cancer, brain and central nervous system (CNS) cancer, breakt cancer, concer, colon and rectum cancer, connective tissue cancer, ocsophageal cancer, colon and rectum cancer, connective cancer, leukaemia, live cancer, lung cancer, kidney cancer, larynx cancer, lawyloma, melanoma, myeloma, oral cavity cancer, ovarian cancer, pancreatic cancer, prostate cancer, rhaddomyosarcoma, skin cancer, stochach cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the for treating or preventing exemplification of the invention

Producing sub-population of labeled nucleic acids, useful for analyzing differences in RNA profiles between several different physiological sources, using set of distinct gene specific primers.

Example 3; SEQ ID NO 680; 11pp; English.

The invention relates to producing a sub-population of labeled nucleic acids (NAs) comprising contacting a NA sample from a physiological source, with a pool of So distinct gene specific primers under suitable conditions to enzymatically generate sub-population of NAs, where each gene specific primer has a sequence complementary to a distinct mRNA, and method is useful for producing a single gene specific primer. The method is useful for producing a sub-population of labeled NAs which is useful for analysing the differences in the RNA profiles between several different physiological sources, where the method comprises producing subpopulation of labeled NAs for the different physiological sources, comprising the oppulations for each physiological source to identify differences in the population, where the comparison is preferably

; performed by hybridising the labeled NAs for each of the distinct physiological sources to an array of probe NAs stably associated with the surface of a substrate to produce a hybridisation pattern for each of the sources, and comparing the patterns for each of the sources, where differential gene expression assays are utilised in differential expression analysis of diseased a normal tissue e.g. neoplastic a normal tissue, or different tissue or subtissue types. The present sequence is a human gene specific PCR primer used in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO Gaps ö http.wipo.seqdata.uspto.gov/sequence.html?DocID=6352829B1 1.0%; Score 27; DB 1; Length 27; 100.0%; Pred. Treating non-allergic inflammatory diseases, such as psoriasis, ecze allergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.

English Disclosure; Page 32; 229pp; The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic context dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid

The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention describes a composition (I) of matter comprising an oligomer or polymer having two or more labeled groups, where the label or coligomer or polymer, one or more cactive groups, and one or more charged groups where the charged groups reactive groups, and one or more charged groups where the charged groups are covalently linked to the oligomer or polymer or comprise part of the backbone of the oligomer or polymer, or any of their combination. Also described are: a composition (II) comprising a target molecule that has been labeled using (I); and a composition (III) prepared by a target of tabeling process comprising (I) providing a target for labeling, and a capture of the labeling reagent to form the composition having the target and the labeling reagent to form the composition having the community of the labeling an analyte in a specimen; and detecting or quantifying an analyte, which involves providing (II) or (III) where the target is an analyte, which involves providing (II) or (III) with a specimen suspected of containing the analyte and the analyte is an analyte (II) bound to analytes in the specimen contacting the analyte with the securing the analyte. (I) detects or quantifies analyte with this sensitivity. In (I), the multiple labeled groups increases the amount of signal that is added to the analyte specific moiety, the amount of signal that is added to the analyte specific moiety, the groups to a desirable target and the presence of charged group increases the solubility. This sequence represents a multisignal labeling reagent
                                                                                                        Composition of multi signal labeling reagents, useful for detecting or quantifying analyte in specimen, has oligomer/polymer having labeled moieties, reactive groups and charged groups linked to oligomer/polymer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 27 BP; 0 A; 0 C; 0 G; 22 T; 5 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                       Example 7; SEQ ID NO 3; 20pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 associate oligonucleotide.

The present invention relates to a method for augmenting T-helper 1 cells
                                                                                                                                      Immunostimulant, Antiinflammatory, Antipsoriatic; Gastrointestinal-Gen., Antiulcer, Dermatological, Antiallergic, helper T-lymphocyte, immune stimulation, inflammation, psoriasis; inflammatory bowel disease, Crohns disease, ulcerative colitis; eczema; skin allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (Th1)-like immune activation in a subject. The method comprises administrating an immunostimulatory nucleic acid (I) to induce Th1-like immune activation; and administrating a cyclooxygenase inhibitor (II) to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of an immunostimulatory nucleic acid and a cyclooxygenase inhibitor to augment T-helperl cells like immune activation and to treat non-allergic inflammatory diseases, e.g. psoriasis and Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  inhibit prostaglandin expression, is new. The present sequence is one such immunostimulatory nucleic acid. (i) is useful for treating non-allergic inflammatory diseases such as psoriasis, inflammatory bowel diseases (Crohn's disease and ulcerative colitis), eczema, allergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1.0%; Score 27; DB 1; Length 27; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, urticaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose

                                                                                                                                                                                                                                             Primer P41+ corresponds to nucleotides -735 to -706 relative to the transcription start site in the upstream region (see AAV15448) of the Arabidopsis PR-1 gene (see AAV15448). It was used in non-coding strand analysis of the PR-1 promoter region. In vivo footprinting analysis was performed of the PR-1 promoter region. Inducible in vivo footprints are located at positions -629 and -628 and at position -604 on the coding strand and at position -641 on the non-coding strand. The use of PR-1 promoter fragments to regulate gene expression in plants in the presence of chemical inducers is disclosed
                                                                                                                                                                                                   New chemically inducible promoter from Arabidopsis - used to regulate gene expression in response to e.g. salicylic acid.

The present sequence is one of a number of oligonucleotides which were used for the generation of RNA-protein fusions, including fusions having a myc epitope tag. The RNA-protein fusions comprise a protein covalently consisted to the 3' end of its own mRNA. This is accomplished by synthesis and in vitro or in situ translation of an mRNA molecule with a peptide acceptor attached to its 3' end. The RNA-protein fusions are incubated counder high salt conditions to produce a protein library. This method is cuseful for improving or altering existing proteins, as well as for isolating new proteins and nucleic acid or small molecule targets. It may can be used to improve human or humanised single-chain antibodies for the treatment of a number of diseases. The method is useful for the constitution of proteins with specific binding properties, for screening contractions. Unlike prior art, the new method does not rely on complex, which is very fragile and is therefore of limited use. The mathod does not rely on topological links between the protein and the conditions of the information of the protein is retained and can condition and can be recovered in readable, nucleic acid form
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                      The sequence represents part of a branched encoding molecule used in methods to hybridise a capture probe to the addressing element of a DNA linker attached to am in vitro translated protein, in order to immobilise the protein to a solid support. The new methods are useful for tagging or encoding in vitro translated proteins with unique and minimal encoding concious and sorting these molecules onto solid supports. They are also useful for the identification of a desired binding partner. The method allows the use of pre-made sets of universal encoding molecules, such as nucleic acid(s) (analogues). These can be used in conjunction with nucleic acid(s) (analogues). These can be used in conjunction with corresponding universal microarrays or sets of microparticles to create new protein display systems which are flexible, modular, scalable and cost effective. The method allows the use of mucleic acid analogue which are not susceptible to enzymatic incorporation or polymerisation and are superior to conventional DNA/RNM. The proteins can also be labelled with fluorescent groups which can be used to monitor the protein in real time. The absence of RNA is advantageous as they can adopt secondary structures which are difficult to predict and can interfere with hybridisation steps and protein folding/function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                      nucleic

This invention describes a novel test system (A) which comprises at least one immobilized analyte (I) on an insoluble carrier and a polypeptide detection agent (II). specific for (I) and conjugated, via a linker, to an amplifier (III). (A) is used for direct, in vitro detection of (I) with amplification of the signal by polymerase chain reaction (PCR), or a related technique, applied to (III). The method is useful in biomedical diagnosis and environmental monitoring and can be used to detect a wide range of (I), e.g. diagnostic or pharmaceutical agents, secondary metabolites, herbicides or pesticides. (A) allow simultaneous, parallel detection of many different analytes (high throughput capacity).

The caltively simply (only a few incubation and washing steps are required) and with high sensitivity and selectivity. This sequence represents primer used in the ampification of the c-myc DNA fragment which encodes an epitope used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                    System for detecting immobilized analyte, useful e.g. for biomedical diagnosis, has as detection agent specific polypeptide coupled to nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Biological material detection, electrophoresis, bioprobe isolation, alpha factor receptor, STE2; linker, ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAK98637;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 158
```

```
Detecting and purifying biological material by (di)electrophoresis, useful e.g. for separating tissues and viruses, comprises using a probethat alters (di)electrophoretic properties.
```

Example 1; Page 12; 20pp; German

The present invention relates to a method for the detection or purification of biological material by electrophoresis, which comprises (i) treating the biological material containing different species with a bioprobe and (ii) establishing an electric field for detection or purification of at least one complex formed between the biological material being tested and a specifically bound bioprobe. The method is wiruses, proteins, nucleic acids, lipids and/or other organic compounds. It can also be used for the isolation of specific bioprobes from a library of bioprobes. The present sequence is a linker described in the library of bioprobes. The present exemplification of the invention

Selection of specific protein by screening protein-RNA fusions generated in vitro or in situ - useful for, e.g. identifying enzymes and antibodies with altered properties, potentially useful as catalysts or for therapy diaqnosis.

Disclosure; Page 39; 94pp; English.

The Oligonucleotides AAV48087, AAV48089-V48091 and AAV48096-V48098 and

the selection of a specific protein or RNA, by in vitro or in situ translations were used to generate RNA-protein or short or in situ translation of candidate RNA molecules to produce RNA-protein fusions, then selecting specific RNA protein fusions. The method is used to select proteins (or DNA encoding them) having altered properties, e.g. for identification of new binding reagents, to identify improved human antibodies or new enzymes. These proteins are potentially useful in diagnosis and therapy, or as industrial catalysts. The methods allow many counds of selection and amplification to be performed, resulting in enrichment of even very rare molecules and allowing isolation of proteins that bind specifically to almost any compound or catalyse almost any reaction 8.89999999999888

producing a nucleic acid construct, for producing a protein nucleic acid conjugate, comprises partial annealing a two single stranded nucleic acids, and coupling the nucleic acids to a third single stranded nucleic acid. 

Example 1; Page 30; 85pp; Japanese.

The invention describes a method of producing (M1) a nucleic acid construct having a first, second and third single stranded nucleic acid. The method comprises: coupling the first and third single stranded concerned by a chemical bond present on the same terminals of each nucleic acid by a chemical bond present on the same terminals of each cucleic acid; and coupling the second and third single stranded stranded nucleic acid by ligase. Also described are: a nucleic acid construct (I) nucleic acid by ligase. Also described are: a nucleic acid construct (I) obtainable by coupling the protein nucleic acid conjugate (II) obtainable by coupling the protein encoded by a coding sequence with (I); a DNA-RNA-coupling the protein encoded by a coding sequence with (I); and a double stranded DNA-protein conjugate obtainable by carrying (II); and a double stranded DNA-protein conjugate obtainable by carrying out a polymerase reaction with DNA and a degrading RNA of (III). (M1) is useful for producing a nucleic acid construct having a first, second and third single stranded nucleic acid. (I) Is useful for producing (II)

```
which involves coupling protein encoded by (I) with (I) by a nucleic acid derivative. (I) Is translated with a protein translation system after heating (I) at 60 - 90 deg C and cooling (I) after the heating step. The method is useful for purifying (II) which involves separating and refining (II) by the labeling substance present on the third single of DNA or RNA that encodes a protein which involves selecting and purifying (II) and amplifying the coding sequence of (II). (II) Is useful for producing (III) which involves performing reverse transcription of mRNA of (II). (MI) Enables production of (I), which in turn enables efficient production of (II). This sequence represents a polynucleotide associated with the nucleic acid construct production method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mononucleotide repeat locus; human; BAT26; probe; microsatellite; tumour;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting mutated polynucleotides in a large population of wild-type bolynucleotides, useful for e.g. detecting cancer, comprises using polymerase chain reaction amplification of extension products from mutant polymucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to detecting a mutant polynucleotide in a mixture of mutant polynucleotides, wild-type polynucleotides and unrelated polynucleotides, comprises using polymerase chain reaction amplification of extension products produced from mutant polynucleotide templates and by extension primers and probes. The method is useful in detecting mutated polynucleotides within a large population of wild-type polynucleotides. The method may be used in diagnosing or detecting cancer, such as colorectal cancer, in an individual. The present sequence
defined number of repeats, and determining the melting point temperature of the hybrid. The method is used to analyse microsatellites, especially microsatellite instability, particularly as a means for detecting hereditary tumours. Alternatively, the method is used to identify an individual in a population. The present sequence is a probe for Mononucleotide repeat locus BAT26, and was used to illustrate the

The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytokines. It can be useful for enhancing an immune response treating diseases, including pathogenic infection, (non-)malignant tumnours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergic finitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New immunostimulatory compositions comprising RNA/DNA hybrid oligonuclectides, useful for enhancing an immune response or inducing cytokines, particularly for treating diseases, e.g. cancer, allergy or HIV infection.
                                                                                                                      Phosphorothioate substituted RNA/DNA hybrid oligonucleotide SEQ ID NO:

This invention describes a novel method for the selective detection of nucleic acids which comprises amplification of the nucleic acid with the help of labeled primers and detection with a trap probe. The methods and reagents are used for the detection of a marker primer and at least 2 immobilized (or immobilizable) trap probes with the corresponding nucleic acid sequence of interest for mutation analysis. The method can be used to detect a specific sequence in a sample of one or more nucleic acids by using several sets of primers and trap probes (i.e. in an array). The methods are useful in molecular biology and disgnostic applications, especially for simultaneous detection of multi-pathogens, typing of organisms, analyzing genetic diversity and sequencing of genes or genomes. This sequence represents a primer used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Coxsackie virus strain VD2921; diabetogenic coxsackie B virus-4; CBV-4; strain VD2921; VP1; VP2; VP3; VP4; P2A; P2B; P2C; P3A; P3B; P3C;

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(s). Also described are: method of determining (M2) microsatellite markers (MM) for a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or concerned pML, and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a diseases and for prediagnosis of such diseases especially prion diseases. Cut also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, companient of particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the cow prion companient (PTP) comprising a polymorphic microsatellite locus.
                                                                                                                                        Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic nucleic acid probes - comprising two nucleic acid sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 26.2; DB 1; Length 31; Pred. a scissile linkage.

linked by

Length 26;

```
The patent claims a new molecule of formula (NA1----S----NA2)n. NA1 and NA2 are noncomplementary nucleic acid sequences; ---S--- = a scissile linkage; n= 1 or 1,000, which is used for the detection of specific DNA or RNA sequences in a test soln. The scissile link probes may be PL (Permanent Linkage to Solid Support) or HL (Hydrolysable Linkage to Solid Support). The differential liability of DNA and RNA may be exploited in a heterogenous system when the scissile linkage is an RNA molecule in the examples, counter probe molecules 9 through 16 were used to determine suitable hybridisation conditions. (Updated on 03-OCT-2002 to add missing OS field.)
                                                            The patent claims a new molecule of formula (NA1----S----NA2)n. NA1 and NA2 are noncomplementary nucleic acid sequences; ---S-- = a scissile linkage. n= 1 or 1,000, which is used for the detection of specific DNA or RNA sequences in a test soln. The scissile link probes may be FL (Permanent Linkage to Solid Support) or HL (Hydrolysable Linkage to Solid Support) or ML (Hydrolysable Linkage to Solid Support) or HL (Hydrolysable Linkage to Solid Support). The differential liability of DNA and RNA may be exploited in a heterogenous system when the scissile linkage is an RNA molecule. In the examples, counter probe molecules 9 through 16 were used to determine suitable hybridisation conditions. (Updated on 03-OCT-2002 to add missing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic nucleic acid probes - comprising two nucleic acid sequences linked by a scissile linkage.

It is used by reacting excess probe with a target nucleic acid; nicking hybridised probe at least once within a predetermined sequence to form 2 or more probe fragments hybridised to the target sequence, which results in the probe fragments becoming hybridised to another probe; and identifying probe fragments becoming hybridised to another probe; and identifying probe fragments, so detecting the target sequence. The probe can react with target sequence to complete a cycling sequence. Using this system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

It is used by reacting excess probe with a target mucleic acid; form 2 or more probe at least once within a predetermined sequence to form 2 or more probe fragments hybridised to the target sequence, which results in the probe fragments becoming hybridised to another probe; and identifying probe fragments, so detecting the target sequence. The probe can react with target sequence to complete a cycling sequence. The probe system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Probe MRCO60 is bound by a hydrolysable linkage to a solid support at its

The present invention describes a method of producing full-length cDNA libraries from single cells, designated single-cell cDNA library amplification (SCLA). The method is useful in gene chip technology, differential screening, pathological diagnosis, physiological prognosis and genetic identification. No further information about this sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; phosphodiesterase; PDE; zcytor13; antiasthmatic; antiarthritic; antipsoriatic; cytostatic; antiatherosclerotic; antinfertility; cardiant; antinflammatory; dermatological; wound healing; antiviral; antibacterial; therapy; inflammatory bowel disease; diverticulitis; spermatogenesis; sperm capacitation; immunocontraceptive; vaccine; cancer; reperfusion ischaemia; psoriasis; melanoma; myocarditis; PID;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
Generating a complete full-length cDNA library from single cells for in gene chip technology, involves reverse transcribing intracellular mRNAs, adding polynucleotide tail and amplifying formed cDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human full length zcytor13 cDNA isolating polyA PCR primer, ZC7764b.

The patent discloses novel human phosphodiesterase (PDE), zcytor13 cDNA and its corresponding protein. Zcytor13 protein is used to promote wound tealing in tissues, to exhibit anti-bacterial and anti-viral effects and to identify modulators (e.g. agonists or antagonists). Zcytor13, its action as are useful in the treatment of inflammatory heart or cardiovascular conditions, muscle inflammation, inflammation, heart or cardiovascular conditions, muscle inflammation, inflammation, as and after surgary, arthritis asthma, inflammation, inflammation, as immunocontraceptive or anti-fertility vaccine and for treating male infertility. Zcytor13 protein and its antibodies are used to diagnose cancer, reperfusion ischaemia, asthma, psoriasis and melanoma. Zcytor13 corteins are used to enhance fertilisation. Zcytor13 antagonists are used to cracer, reperfusion ischaemia, pelvic inflammatory disease. [PID), corteins are used to enhance fertilisation. Zcytor13 antagonists are used to ensure and other inflammatory disease. [PID), corteins are used to enhance fertilisation. Zcytor13 antagonists are used to sasociated with vasoconstriction, heart arrhythmia, congestive heart disease, muscle spasms and fatigue. They are used for detecting human chromosomal abnormalities. Zcytor13 cDNAs are used in gene therapy.

C Zcytor13-cytokine fusion proteins or antibody-cytokine fusion proteins care useful for enhancing in vivo killing of target tissue. The present csquence is a polyA PCR primer, Zc7764b which is used to isolate full
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                  Novel human phosphodiesterase polypeptide, zcytor13 and polynucleotide encoding it, for detecting human chromosomal abnormalities, identifying modulators and treating inflammatory and cardiovascular diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

```
Polynucleotides encoding salivary proteins useful as anti-microbial
                                           agents.
```

Example 1; Col 53; 29pp; English

region of human chromosome 4 and encoding a zsig63 polypeptide, a microbial activity. Due to their microbial activity. Due to their microbial activity, the sequences can be used in the study of microbial infections, e.g. for recombinant production of anti-microbial proteins. The sequences can be used in the treatment of tooth decay, periodontal disease, thrush, gastrointestinal disease, urinary tract infections, vaginal infections, spitchellal wounds, chronic tissue damage, acquired immunodeficiency syndrome (ADDS), cystic fibrosis, lung infections, sarcoidosis, emphysema and chronic bronchitis. This sequence represents a sequencing primer for CDNA encoding human zsig63 The invention relates to a polynucleotide derived from the 4q12-4q13

Novel secreted salivary protein, zsig63 and polynucleotide encoding it useful for treating microbial infections, inflammatory conditions, dental caries and lung infections associated with cystic fibrosis.

Example 1; Page 29; 33pp; English

The present invention relates to a new secreted salivary protein, zsig63. The invention is useful for detecting in a test sample, the presence of an antagonist or agonist of zsig63 protein activity. The invention is also useful as an immunogen for producing an antibody to zsig63 polypeptide. zsig63-cytokine fusion proteins or antibody cytokine fusion proteins or antibody-cytokine fusion proteins or antibody-cytokine fusion proteins or antibody-cytokine fusion protein are useful for enhancing in vivo killing of target tissues. The manaceutical composition comprising purified zsig63 polypeptide are useful in the treatment of conditions associated with pathological microbes, including bacterial, fungal and viral infections. High polypeptides are useful for treatment of dental caries (tooth decay), periodontal disease, thrush and gastrointestinal disease. Other prevention of infection in winnary tract infections, vaginal infections, prevention of infection in skin and other epithalial wounds. The polypeptides can be used to establish normal microflora and protect against pathogenic colonisation and invasion. The invention is useful when pro-inflammatory activity is desired. Applications for such pro-inflammatory activity is desired. Applications for such pro-inflammatory activity is desired. Applications for such pro-inflammatory activity is almitted or damaged vascular system e.g., damage in extremities associated with diabetes. Antagonists to zsig63 cuseful for the treatment of pathents having incompetent immune system, and purch as and contribations. such as AIDS (acquired immunodeficiency syndrome) patients amuno system; that have undergone chemotherapy, radiation treatment. The invention is also useful for the treatment of lung infections associated with cystic fibrosis and its agonists or antagonists are useful for aiding digestion. The present nucleic acid sequence represents a PCR primer that was used in the methods of the invention for identification of zsig63

                      The invention relates to producing a sub-population of labeled nucleic acids (NAs) comprising contacting a NA sample from a physiological acids (NAs) comprising contacting a NA sample from a physiological conditions to enzymatically generate sub-population of NAs, where each conditions to enzymatically generate sub-population of NAs, where each labeled nAs is generated using a single gene specific primer. The method is useful for producing a sub-population of labeled NAs which is cuseful for analysing the differences in the RNA profiles between several different physiological sources, where the method comprises producing cuspulation of labeled NAs for the different physiological sources, comprising the populations for each physiological source to identify differences in the population, where the comparison is preferably comprising the population, where the comparison is preferably difference by physiological sources to an array of probe NAs stably associated with the surface of a substrate to produce a hybridisation pattern for each of the sources, where differential gene expression assays are utilised in differential expression analysis of diseased a normal tissue e.g. neoplastic a normal cypecasion analysis of diseased a normal tissue e.g. neoplastic a normal cypecasion analysis of diseased a normal tissue e.g. neoplastic and the sequence data for this patent did not form part of the printed the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at http.wipo.seqdata.uspto.gov/sequence.html?pocID=635282981
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to human secreted salivary polypeptide designated as zaig63 and nucleic acid molecules encoding such polypeptides. Zaig63 can be used in detecting agonists and antagonists of its acityity, and is also useful as a host defense polypeptide. immune modulating factor, antipathogenic polypeptide, call-cell signalling molecule, growth factor, cytckine, or as secreted extracellular matrix associated protectins with growth factor hormone activity. It is useful for treating conditions associated with pathological microbes, including bacterial, fungal and viral infections, for treating dental carries (tooth decay), periodontal disease, thrush and gastrointestinal disease, for treating urinary tract infection, vaginal infection and for preventing infection in skin and cother epithelial wounds. zsig63 is useful for establishing normal cother epithelial wounds. zsig63 is useful for establishing normal cother epithelial wounds. zsig63 is useful for establishing normal cother pathological minipage e.g. damage in extremities associated with disease and useful as anti-inflammatory agents. It is useful as a marker of lung dysfunction, salivary gland dysfunction, or dysfunction of prostate gland. It is also therapeutically useful for aiding digestion. Polymuclectides of the invention are used in gene therapy for increasing cor inhibiting zsig63 activity, for detecting abnormalities on human chromosome 4 associated with disease or other human traits and as consecuted in forensis DNA profilling. Sequences of the invention are useful for stimulating proliferation or differentiation of adipocytes and for monormal sequences. It is a second to a second or differentiation of and or and proved the province as a second or servince or inhibiting chondrosarcoms, atherocleories, restenoslas and observe. The monormal sequences of the province of a second or experience or the invention are second or experiences and provinces of the invention or experiences. The second or experiences of the provinces of the province or an

```
polynucleotide tag from a biological sample by cleaving one of the complementary strands of a double stranded polynucleotide with a cleavage agent capable of recognising a double stranded polynucleotide comprising complementary strands and cleaving only one of the strands of the polynucleotide in the process of generating a single stranded polynucleotide tag. The method is useful for separating, analysing, quantifying or obtaining single stranded polynucleotides comprising originating partly, and preferably wholly from a source of DNA and/or RNA in a sample comprising biological cells. The method is particularly for analysing gene expression (expression profilling or differential gene expression), or in diagnosing clinical conditions. The present sequence is a primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunostimulant; oligodeoxynucleic acid; ODN; vaccine; DNA-RNA hybrid;
for analyzing gene expression or diagnosing clinical conditions, comprises employing nicking endonucleases that cleave complementary
                                                                                                                          The invention relates to a method for obtaining a single stranded

                                                                                                                                                                                                                                                                The present invention relates to the isolation of a novel cytokine, alphanal Ligand and the polymucleotide encoding it. The invention also gives the sequence for the zalphal Ligand polymerotide stimulates proliferation of encoding it. The zalphal Ligand polypeptide stimulates proliferation of matural killer (NK) cells or NK cell progenitors, the activation of NK cells, proliferation of T-cells, proliferation of B-cells stimulated with anti-CD40 antibodies, stimulates an antigenic response in a mammal, and talphall Ligand polypeptide is also useful in preparing antibodies. The zalphall Ligand polypeptide is also useful in preparing antibodies that bind to zalphall Ligand epitopes. The zalphall Ligand epitopes or primers to clone regions of a zalphall Ligand gene, be used as probes or primers to clone regions of a zalphall Ligand gene, and in gene therapy. Zalphall Ligand may also be used to identify inhibitors of its activity, to enhance the generation of anti-tumour responses with or without the infusion of donor lymphocytes, and to activate or stimulate the immune system. The present sequence represents a sequencing primer used to sequence cibNA clones in the isolation of human zalphall Ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

ö invention is based on the discovery that ODNs containing deoxyuridine invention is based on the discovery that ODNs containing deoxyuridine residues (U-ODNs) have an immunostimulatory effect comparable to, or in many instances greater than, ODNs containing CDG motifs, producing higher numbers of specific T cells to a given antigen. The U-ODNs do not induce CCG ODNs, are not dependent on a specific motif or a palindromic sequence. Use of a U-ODN for the preparation of a vaccine is claimed. Combining the U-ODN with an antigen strongly increases the potential of the antigen to raise the protection/immune response of a vaccinated individual. An example of the invention demonstrated the generation of a specific immune response edgins a vaccinated segmentic immune response against a malanoma-derived peptide (see es; PCR; zeig63; adhesin; salivary gland; dental carries; perinelial wound; urinary tract infection; vaginal infection; skin infection; primer; pro-inflammatory; chronic tissue damage; vascular system; diabetes; AIDS; lung infection; cystic fibrosis; lung dysfunction; digestive; salivary gland carcinoma; Pneumocystis carinii infection; emphysema; chronic bronchitis; prostate dysfunction; prostate adenocarcinoma; cell culture media; gene therapy; human chromosome 4q12-4q13; dentinogenesis imperfecta; dentin dysplasia type II. The invention relates to an isolated zsig63 polypeptide comprising at least 90% identity to an amino acid sequence which comprises domain 1 of Novel isolated zsig63 polypeptide, member of the adhesin family, useful for treating dental carries, periodontal disease, thrush, gastrointestinal disease, urinary tract infections, vaginal infections, Gaps ö 0.9%; Score 26; DB 1; Length 26; 00.0%; Pred. Improved polymerase thermocycling reaction for nucleic acid amplification, by thermal cycling of promoter-linked nucleic acid template synthesis and in vitro transcriptional amplification of nucleic acid sequences.

Example 4; Page 14; 28pp; English.

The invention relates to an improved polymerase thermocycling reaction (MI) for linear amplification of mucleic acid sequences, involves denatured (I) with a promoter-containing primer (PI), combining the denatured (I) with a promoter-containing primer (PI), a primer (P), a number of deoxymucleotide triphosphares and thouse of promoter-containing templates, contacting Pa with the denaturing the promoter-containing templates, contacting Pa with the denatured promoter-containing templates, containing templates, contacting Pa with the denatured promoter-containing demble-erranded mucleic acid templates are flanked by Pi in one on and Pi in the other and of the other orientation, transcribing the promoter-containing double-erranded moles transded mucleic as number of promoter-containing double-erranded DNA templates to form a number of containing double-erranded DNA templates to form a number of pulpares including the primer region of the promoter-containing double-erranded DNA templates, contacting the amplified RNA sequences, including the primer region of the promoter-containing double-erranded DNA templates, contacting the amplified RNA sequences, including the primer region of the promoter-containing double-erranded DNA templates, contacting the amplified RNA sequences, including the primer region of the promoter-containing double-erranded DNA templates, contacting the amplified RNA sequences of colls in both normal and diseased states, comparing the call should be generate multiple coffice by the calls in both normal and diseased states, emplifying the action of the calls in the normal and diseased state, determining the differences in mRNA composition of the call (S) in the diseased state, determining the malk and determining aberrant production, by the isolated mRNA will should be promoter protein producing an antisense cort the isolated mRNA and accompanies of the mRNA sequence of the mRNA in calling the companies of the mRNA and accompanies of the mRNA and using recompanies by the aberrant protein by dete produce second strand cDNA in the method of the invention

pathogen, useful for enhancing anti-tumor activity resulting in reduced tumor progression or metastasis, comprises administering zalphall ligand antigen or an Stimulating an immune response in a mammal exposed to polypeptide.

Example 7; SEQ ID NO 38; 103pp; English.

The invention fracts to stimulating an immunic response in a manufact comprising mature zalphall ligand polypeptide comprising a composition comprising mature zalphall ligand polypeptide comprising residues 32-162 comprising mature zalphall ligand polypeptide comprising residues 32-162 comprising; (a) determining (in) directly the level of antigen or pathogen present in the mammal; (b) administering a composition comprising salphall ligand polypeptide in a pharmaceutical vehicle; (c) determining (in) directly the level of antigen or pathogen in the mammal; (c) and (d) comparing the antigen or pathogen level in (a) with (b), where a change in the level indicates stimulation of immune response), and stimulating an immune response in a mammal exposed to an antigen or pathogen (comprising: (a) determining a level of immune response), and stimulating an immune response in a mammal exposed to an antigen or pathogen (comprising: (a) determining a level of antigen- or pathogen-comprising: (b) administering a composition comprising alphall ligand polypeptide in a pharmaceutical vehicle; (c) determining a post of c) comparing the level of the antibody in (a) with (b), where and increase in the antibody level indicates stimulation of immune response). The method is useful for stimulating an immune response in a mammal corresponse in a mammal antigen or pathogen, and for enhancing anti-tumour, a lymphoma or a B cell tumour may be a haematopoietic tumour, a lymphoma or a B cell tumour may be a haematopoietic tumour, a lymphoma or a B cell tumour may be a haematopoietic tumour, a lymphoma or a bealt of diseases arising from defects in the immune system; or systemic lupus erythematosus, rheumatoid arthritis, myasthemia gravis, or immunocymented por pathogen and diseases, treating and antigented in antigen or harlond antiful anticated and in immorymented and antigen and antigen and in antigen or pathogen. The invention relates to stimulating an immune response in a mammal immunocompromised patients, such as HIV+ patients and in improving vaccines. The present sequence is a sequencing primer used in the

                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel isolated zalphall ligand polypeptide. The polypeptide of the invention may be useful for boosting immunity to infectious diseases and treating immunocompromised patients, such as HIV patients, as well as in improving vaccines. The current sequence is that of the PCR primer which was used in the exemplification of the invention.
                                                                                                          Sequencing primer SEQ 38 used to analyse human zalphall ligand clone DNA.
                                                                                                                                                                                                                                                                                                                             New zalphall ligand polypeptides, useful for boosting immunity to infectious diseases, and treating immunocompromised patients, such as human immunodeficiency virus (HIV) patients, or in improving vaccines.

a targeted gene in a substrate, comprising a DNA-RNA hybrid. (I) is useful for inhibiting the expression of the targeted gene in a substrate; comprising a DNA-RNA hybrid. (I) is useful for inhibiting the expression of the targeted gene in a substrate. The substrate is a proxibation such as a viral or bacterial cell, or cukaryote is a mouse, rat, chimpanzee, preferably a human being. (I) is entaryote is a mouse, rat, chimpanzee, preferably a human being. (I) is caracteristic is chosen from expression of a protein, cell division rate and pigmentation. (I) has an effect that lasts at least three days. (I) is useful to inhibit the expression of messenger RNA in a cell. The messenger RNA is transcribed from a gene chosen from viral gene, oncogene, enzyme. (I) is useful for suppressing cancers, by knocking out cancer related genes, for preventing and treating microbial infections, preferably reducing viral pathogenic infection and for reducing the proliferation of cancer cells. This sequence represents a poly(dT)-26mer primer used in the creation of DNA-RNA hybrids for controlling gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention decribes a composition (I) for inhibiting the expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cytostatic; zalphall ligand; pharmaceutical; cancer; immune response; melanoma; tumour; solid tumour; haematopoietic tumour; lymphoma; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Composition useful for inhibiting the expression of a targeted gene in substrate, and for altering a characteristic of a eukaryote, comprises

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠ
                                                                                                                                                                                                                                                                                                    The invention describes an isolated polypeptide comprising a sequence of amino acid residues that is at least 90 or 95% identical to residues 41 (Gln) to 148 (Ile), or 32 (Gln) to 148 (Ile) of a sequence of 162 amino acids (SEQ ID NO:2, human zalphall ligand), fully defined in the specification. Also described are: a pharmaceutical composition comprising the polypeptide, and a vehicle; a method of trimulating an immune response in a mammal with melanoma; an method of stimulating an immune response in a mammal bearing a tumour; an isolated polymucleotide comprising a sequence of nucleotides contact an isolated polymucleotide comprising a sequence of nucleotides encodes a polypeptide that binds a receptor comprising 538 amino acids, fully defined in the specification; a pharmaceutical composition comprising the polymucleotide encoding, in a pharmaceutically acceptable comprising the polymucleotide encoding, in a pharmaceutically acceptable comprising the comprising parably linked a lamant. Sequence of nucleotides comprising the collowing parably linked a lamant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      elements a control element; and a DNA segment comprising the polynucleotide, and an isolated polynucleotide molecule comprising at least 10 nucleotides of the polynucleotide sequence of 642 bp, fully defined in the specification. The molecules, compositions and methods are useful for treating cancer, e.g. melanoma, solid tumour, haematopoietic tumour, or lymphoma. This sequence represents a primer used in the expression cloning of human cytokine zalphall ligand.

The present invention relates to experimentally analysing boundaries within polymeric DNA or RNA molecules comprises hybridizing first and second different RNA molecules, derived from first and second samples, to provide RNA / RNA hybrids. The product of the method above is used as a probe. The method is useful in experimentally analysing boundaries within polymeric DNA or RNA molecules. The methods are useful in analysing polymeric nucleic acid sequence variations and in identifying molecules of therapeutic interest. The present sequence represents a RNA primer of

                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                            ö
                                                                                                                        The invention comprises a fusion protein that contains a zalphall ligand and a cytokine polypeptide (e.g. IL-2, IL-4, IL-15 or GM-CSF), the fusion protein of the invention binds to the human receptor protein. The protein of the invention is useful for stimulating the proliferation and/or development of hematopoietic cells. The protein of the invention is also useful in autologous marrow culture. The present DNA sequence represents a PCR primer that was used in an example of the invention.

                                                  The present invention relates to zsig63, a novel secreted salivary protein and its encoding polynucleotide. Zsig63 is a member of the adhesin family. The invention is useful for diagnosing and treating microbial infections such as dental carries, periodontal disease, thrush, gastrointestinal disease, unimary tract infection, vaginal infection, skin infection or epithelial wounds and lung disfunctions such as AIDS, lung infections and cancer. The invention is also useful in gene therapy. The present sequence is human Zsig63 cDNA cloning and sequencing primer. This sequence to obtain the full-length Zsig63.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a novel method for parallel sequence analysis of nucleic acids (NA) by optical means using a novel solid phase (SP). The SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids, so the background remains low even after prolonged an repeated contact of the solid phase with high concentrations of labeled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA chip; biochip; DNA detection; DNA microarray; DNA sequencing; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a novel method for parallel sequence analysis of mucleic acids (NA) by optical means using a novel solid phase (SP). The SP is useful for multiple parallel sequencing of mucleic acids and shows reduced non-specific binding of labeled or unlabeled mucleotides and nucleic acids, so the background remains low even after prolonged and respected contact of the solid phase with high concentrations of labeled reagents. The present sequence is that of an oligomucleotide which was used in the development of the novel method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Parallel sequencing of nucleic acids by optical methods, by cyclic primer -matrix extension, using a solid phase with reduced non-specific binding of labeled components.
 reagents. The present sequence is that of an oligonucleotide which was used in the development of the novel method of the invention.

This invention relates to a novel surface of a solid phase (SP), useful in methods for parallel analysis of many individual nucleic acids (NA) by optical methods. The novel SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids. The present sequence is that of an oligonucleotide which was used in the development of the novel solid phase of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Surface of solid phase, useful for parallel, optical analysis of many nucleic acids, has reduced non-specific binding of labeled components.

                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel surface of a solid phase (SP), useful in methods for parallel analysis of many individual nucleic acids (NA) by optical methods. The novel SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids. The present sequence is that of an oligonucleotide which was used in the development of the novel solid
                                                                                                                                                                                                                                                                                                               Surface of solid phase, useful for parallel, optical analysis of many nucleic acids, has reduced non-specific binding of labeled components
